

TURBIDITY MEASURING ARMATURES

TURBISWITCH GA

SAFETY INSTRUCTIONS

- Installation, commissioning and maintenance may only be performed by qualified personnel!
- Only connect the unit to the voltage specified in the technical data or on the type plate!
- Disconnect the unit from the power supply during installation/maintenance work!
- Only operate the unit under the conditions defined in the operating instructions!

APPLICATIONS

Monitoring of:

- Filtration / ultrafiltration
- Reverse osmosis
- Cooling circuits
- Centrifuges / Separators
- Return condensate against product collapse
- Process water / waste water

DESCRIPTION

Turbidity is caused by particles in a medium.

TURBISWITCH GA measures the turbidity of the flowing medium optically. For this purpose, a transmitted light measurement is used in which the transmitter and receiver are opposite each other. The absorption of the transmitted light is detected by the TURBISWITCH GS5 evaluation unit and the preset limit value is precisely monitored. The measurable turbidity values are strongly dependent on the process medium and the nominal width of the transducer. The detectable turbidity is in the range of approx. 50 to max. 10,000 FAU.

The borosilicate windows are treated with anti-soil coating.

A turbidity control unit consists of:

- Evaluation unit TURBISWITCH GS5
- Turbidity measuring armature TURBISWITCH GA... with mounted transmitter (TT-HDR) and receiver (TR-HDR)

Evaluation unit
TURBISWITCH GS5 (410-03),
available separately

TECHNICAL DATA

TURBISWITCH GA1

Material	Stainless steel 316L (1.4404)
Process connection	Flange DIN 2633 PN10
Operating temperature	-10...+100 °C
Maximum pressure	10bar
Sealing rings	EPDM (others on request)

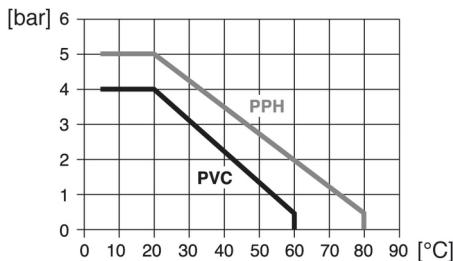

NOTE: The fittings are not designed according to aseptic standards!

Other versions available on request!

TURBISWITCH GA5

Material	PVC or PP
Process connection	Threaded unions for solvent welding (PVC) or fusion welding (PPH) Flange socket on both sides according to DIN 2642
Sealing rings	EPDM (others on request)

Pressure-temperature diagram

The GA1 and GA5 fittings are supplied with the transmitter (TT-HDR) and receiver (TR-HDR) already fitted.

CE mark: The units fulfil the legal requirements of the applicable EU directives.

INSTALLATION

The transducers (TURBISWITCH GA1 and GA5) can be installed both in the main line and in the bypass.

INSTALLATION (continuation)

The turbidity fittings have the following measuring ranges:

The measurable turbidity values depend on the process medium and the nominal diameter of the pipeline.

The minimum detectable turbidity in the LOW range starts at approx. 50...100FAU.

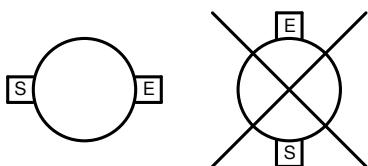

Maximum detectable turbidity in the HIGH range: Approx. 3000...10000FAU (corresponds to approx. 10...30g/ltr SiO₂).

Maximum detectable turbidity in the MEDIUM range: 10% of the HIGH range.

Maximum detectable turbidity in the LOW range: 1% of the HIGH range.

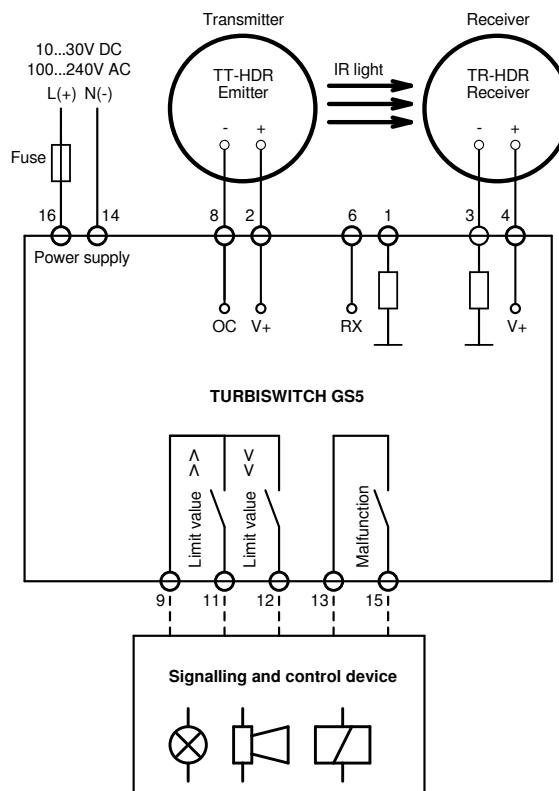

For a reliable measurement, please note the following:

- The windows of the armature must be clean!
- The formation of gas bubbles in the medium should be prevented, otherwise the measurement result will be falsified!
- The position of the transmitter and receiver must always be horizontal to the direction of flow when installed horizontally in order to avoid faulty measurements due to deposits on the windows (see following figure)!

- Only a completely filled pipeline guarantees a correct measurement!
- If necessary, ensure backflow by throttling the outlet pipe or install a siphon.
- Dried-on residues on the windows, e.g. due to standstill of the system, falsify the measurement.
- It is recommended to provide a stilling distance of at least 3 to 5 times the pipe diameter before and after the fitting.
- When mounting in a siphon, a drain cock should be installed so that no liquid escapes when the sensor system is removed.
- To dismantle and mount the windows, use the mounting set supplied (spanner tool for pressure piece and suction cup for glass). Observe torque! (Torque spanner Turbiclick 5.7 optionally available, contact us).

MAINTENANCE

Transducer for pipelines:

- Dirty windows must be cleaned, otherwise the measurement results may be falsified.
- The TURBISWITCH GA... transducer is supplied with a mounting tool for loosening the pressure piece.
- The window can be removed from the fitting with the suction cup, which is also included in the scope of delivery.
- Empty the transducer completely before maintenance or cleaning work!
- Do not use any objects/cleaners for cleaning that could damage the window!
- Limescale deposits can be removed with commercially available descaling agents.
- **The side of the window marked with a dot must be installed again in the direction of the medium!**
- Check the sealing rings (O-rings) for damage and replace if necessary before commissioning!
- The maintenance intervals result from the operating conditions.

The side with the dot is anti-soil coated. Install this side in the direction of the medium!

Information on evaluation can be found in the commissioning of the GS5
